

Building Decentralised Technology Solutions For Humanity

Company Overview

Vaka Consulting designs and implements decentralised technology solutions that unlock social, environmental, and economic value. We combine enterprise architecture, blockchain innovation, and sustainable design to create practical, verifiable, and scalable systems that serve real human needs.

Founded by Phil Lewis, a technology professional and a recognised contributor to the Cardano ecosystem, Vaka Consulting brings together experts in strategy, design, engineering, community and impact to deliver next-generation digital solutions for clients across public, private, and development sectors.

Registered in the Cook Islands, operating across multiple countries

Business Structure: Independent technology consulting firm

Core Team

Our team brings together specialists in enterprise architecture, design, product innovation, blockchain engineering, fintech, and sustainability. Together, we deliver decentralised technology systems that combine technical assurance, design excellence, and measurable impact.

Phil Lewis – Founder and CEO

Phil is a [TOGAF](#) certified Enterprise Architect with more than 25 years of experience in the IT industry and a long-standing contributor to the Cardano ecosystem since 2018. He combines deep technical expertise with the ability to communicate complex concepts clearly to business and non-technical stakeholders — a skill demonstrated in his presentation at the 2024 Australian Crypto Convention on how Cardano's research-driven architecture delivers high-assurance decentralised public infrastructure. In 2024, he was elected to a voting seat on the Executive Steering Committee of [Intersect](#), the organisation driving Cardano's growth and governance through on-chain decision-making.

Before founding Vaka Consulting and building a multidisciplinary team, Phil held senior leadership roles across large corporations and government departments. Notably, he led the design and delivery of a \$75 million education administration system deployed across all public schools in South Australia.

Hung Tran – Head of Strategy and Design

Hung brings a versatile blend of creative leadership and strategic vision, shaped by experience across multinational corporations and high-growth startups. With expertise spanning brand identity, product design, and user experience, he understands how design can drive transformation and create meaningful connections between people and technology.

Known for bridging creativity and strategy, Hung leads cross-functional teams to build cohesive design systems, strengthen brand identity, and deliver impactful digital experiences. Whether shaping design culture from the ground up or guiding established organisations through innovation, he consistently translates complex ideas into elegant and purposeful design outcomes.

[LinkedIn](#)

Matt Roberts-Davies – Head of Product and Partnerships

Matt is an experienced fintech and digital finance professional with more than 12 years of leadership in product development, financial inclusion, and crowdfunding across Africa. He has built and scaled technology solutions for inclusive finance, including partnerships with GIZ, the African Development Bank, and a range of regional fintech and crowdfunding initiatives.

His experience covers platform strategy, regulatory engagement, financial technology innovation, and the delivery of donor-funded projects.

[LinkedIn](#)

Narayan Maharjan – Head of Technology

Narayan leads the technical architecture and on-chain development of decentralised systems, ensuring that all solutions are robust, secure, and scalable. He brings extensive experience across blockchain and traditional technology stacks, including platform engineering, infrastructure deployment, and DevSecOps practices, as well as Cardano smart contract design and integration.

Narayan has several industry recognised certifications from Microsoft and Amazon Web Services.

[LinkedIn](#)

Blane Edwards – Sustainability Architect

Blane is an architect and blockchain creative with a passion for wildlife conservation and sustainable design. His mission is to combine his love of design and blockchain to create innovative environmental solutions that are impactful, scalable, and enduring.

He has contributed to multiple sustainability projects within the Cardano ecosystem, with a focus on user experience, community engagement, and the design of human incentive systems that channel collective action toward positive outcomes.

[LinkedIn](#)

Senny Kalidien – Development Manager

Senny oversees end-to-end project implementation, managing development teams to ensure milestones are met and all modules are delivered to specification.

He brings extensive experience leading complex Web3 builds and contributing to open-source projects. With a track record of delivering enterprise-grade deployments, he balances technical oversight with effective project coordination.

Services & Capabilities

Vaka Consulting provides end-to-end consulting and implementation services for organisations adopting decentralised technologies. Our work spans system design, data infrastructure, digital product development, and sustainability integration — combining strategy, technology, and design to deliver verifiable real-world impact.

Capability Area	Description
Blockchain Architecture	Design and implementation of decentralised systems on Cardano, including token models and issuance, smart contracts, and governance structures.
Impact Finance Systems	Development of data-driven systems for results-based finance (RBF), carbon accounting, and tokenised impact verification.
Data Infrastructure & Verification	Integration of IoT and off-chain data systems for transparent impact reporting and cryptographic proof publication.
Digital Product Design & Delivery	Product design, UX/UI, and front-end engineering for blockchain-enabled platforms.
Sustainability & Systems Advisory	Strategic and technical guidance for organisations developing ESG-aligned digital infrastructure and outcome-based financing solutions.

Portfolio

Our portfolio highlights projects delivered with partners across the public, private, and development sectors — applying decentralised technology to achieve measurable social and environmental outcomes.

Empowa

Designed and implemented a tokenised finance platform to fund affordable housing. The platform's pilot financed climate smart homes for 30 families in Beira, Mozambique on a rent to own variable repayment scheme. More than 50% were women led households and the average client age was 20 years younger than for traditional finance.

Empowa have since built on the success of their pilot by expanding into Kenya, Nigeria and Uganda, as well as scaling up with existing partners in Mozambique to support the financing of a new 25,000 home project.

ClimaFI

Our partnership with ClimaFI is to build the data infrastructure that enables financiers, asset distributors, and investors to fund green technologies sustainably. Their platform connects IoT performance data from economically productive green assets — such as solar mills, pumps, electric vehicles — to financing and impact-reporting systems.

Providing financiers with flexible repayment calculations tied to actual asset use, improves credit access for those with irregular income and allows asset distributors to scale their business and their contribution to a green transition.

Following the achievements of their data platform, we are also working to provide a tokenised impact verification and attribution solution. This will provide a new trust layer for results-based finance (RBF) and carbon subsidy programs. In addition to allowing RBF funders to track the impact of their programs, tokenisation will allow greater payment transparency, as program administrators can provide on-chain payments in exchange for impact tokens issued to the asset distributor or potentially even the end customer.

Sustainable Outcomes Registry (SOR)

Designed a unique tokenisation model (and associated indexing system) that blends Cardano's native asset and UTxO architecture, with Bitcoin's Ordinals protocol. This allows the creation of SOR's Sustainable Outcome Digital Assets (SODAs), for which issuance is based on legally defensible completed outcomes, grounded in recognised methodologies (e.g. certified soil carbon sequestration).

The SODA token model is designed to align with the International Financial Reporting Standards' accounting standard on Intangible Assets (IAS 38), and allows fungible tokens to be used to uniquely identify sustainable outcome projects, individual ownership and verifiable public disclosure. The solution available on Cardano provides efficiencies not available from blockchains that require the issuance of tokens via smart contracts (such as Ethereum), which to achieve the same traceability would incur significant overhead and cost.

Positiva

Positiva are building a platform (in progress) to crowdfund capital for "Impact Assets" — assets that have a positive impact in the world. We are designing and implementing a solution to tokenise fractionalised ownership of the real world assets (RWAs) funded through their platform.

The solution will not only allow interest bearing repayments (made by the users of the assets) to be distributed to the token holders, but it will allow token holders to resell their stake in the assets using decentralised exchanges.

UNDP / SOFF (pre-Pilot)

With the teams at UNDP Procurement and Systematic Observations Financing Facility (SOFF) we are developing a solution to tokenise data from national meteorological services, so a transparent and efficient

payment system can be implemented to incentivise the supply of frequent and globally distributed climate and weather observation data. This data is important to help strengthen climate adaptation and resilience programs.

Better Than Cash Alliance / Carbon Plus (pre-Pilot)

With the Better Than Cash Alliance we are developing a prototype for distributing carbon credit revenue to indigenous landowners in rural Mexico, following recent projects completed by Carbon Plus on behalf of the community.

It will use Cardano to provide transparency around the distribution (> 6000 recipients), while providing a simple interface to abstract away blockchain and wallet complexity to ensure accessibility.

Credentials & Compliance

Vaka Consulting operates with a commitment to professional standards, transparency, and accountability in the delivery of technology and sustainability solutions.

- Registered consulting company in the Cook Islands, operating across multiple countries
 - Led by senior practitioners with internationally recognised technical and design credentials
 - Active contributor to Intersect, the organisation advancing Cardano's ecosystem through on-chain governance
 - Alignment with the United Nations Sustainable Development Goals (UN SDGs), the International Financial Reporting Standards (IFRS), and other internationally recognised best-practice frameworks
 - Adherence to best practices in data protection, information security, and responsible open-source collaboration
-

Why Vaka Consulting

Vaka Consulting brings together enterprise architecture, design, and sustainability project expertise to deliver high-assurance decentralised systems with measurable impact.

Our team combines deep technical experience with a commitment to human-centred design and verifiable outcomes, helping clients implement technologies that serve real social and environmental goals.

- Purpose-driven approach aligning technology with sustainable development outcomes
- Proven track record delivering blockchain and data infrastructure projects across multiple regions
- Experienced multidisciplinary team spanning architecture, strategy, design, and engineering
- Trusted partnerships with innovators, development organisations, and institutional actors
- Commitment to open, transparent, and standards-aligned delivery
